TURRSFILA/RANK. Osteoclast differentiation and activation factor.

TURRSFILA/RANK. Osteoclast differentiation and activation factor.

Augments the ability of dendritic cells to stimulate naive T-cell proliferation. May be an important regulator of interactions between T cells and dendritic cells and may play a role in the regulation of the T cell-dependent immune response. May also play an important role in enhanced bone-resorption in humoral hypercalcemia of malignancy.

-!- SUBCELTULAR LOCATION: Type II membrane protein (isoforms 1 and 3);

Secreted (isoform 2). A soluble form of isoform 1 arises by proteolytic processing (By similarity).

May be involved in cytotoxic T cell mediated apoptosis and in T cell development. TNFRSPE/FAS-mediated apoptosis may have a role in the induction of peripheral tolerance, in the antigen-stimulated suicide of mature T cells, or both. Binding to the decoy receptor TNFRSF6B/DcR1 modulates its effects (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                              28-FEB-2003 (Rel. 41, Last sequence update)

Beneration and initial analysis of more than 15,000 full-length transduces the apoptotic signal into cells. May be involved in cytotoxic T cell mediated apoptosis and in T cell development.

TNRRSF6/FAS-mediated apoptosis may have a role in the induction of peripheral tolerance, in the antigen-stimulated suicide of mature T cells, or both. Binding to the decoy receptor TNFRSF6FDCR3 meduates its effects.

-!- SUBGNIT: Homotrimer (Probable).
-!- SUBGNIT: Homotrimer (Probable).
-!- SUBCELLUIAR LOCATION: Type II membrane protein. May be released into the extracellular fluid, probably by cleavage form the cell Zeytun A., Nagarkatti M., Nagarkatti P.S.;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SIGNAL-ANCHOR (TYPE-II MEMBRANE PROTEIN)
                                                              -!- PTM: N-glycosylated.
-!- PTM: N-glycosylated.
-!- PTM: The soluble form derives from the membrane form by proteolytic processing to proteolytic processing the proteolytic processing the proteolytic processing the proteolytic processing the proteolytic processing the proteolytic area as cause of autoimmune lymphoproliferative syndrome (ALPS) [MIM:601859]; also known as Canale-Smith syndrome (CSS). ALPS is a childhood syndrome involving hemolytic anemia and thrombocytopenia with massive involving hemolytic anemia and thrombocytopenia with massive lymphagenopathy and splenomegaly.
-!- SIMILARITY: Belongs to the turn necrosis factor family.

-! FUNCTION: Cytokine that binds to TNRSF6/FAS, a receptor that transduces the apoptotic signal into cells. May be involved in cytotoxic T cell mediated apoptosis and in T cell development. TNRSF6/FAS-mediated apoptosis may have a role in the induction of peripheral tolerance, in the antigen-stimulated suicide of mature T cells, or both. Binding to the decoy receptor TNFRSF6B/DCR3 modulates its effects (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             28-FEB-2003 (Rel. 41, Created)

transduces the apoptotic signal into cells. May be involved in cytotoxic T cell mediated apoptosis and in T cell development. TYRSPSF/FRS-mediated apoptosis may have a role in the induction of peripheral tolerance, in the antigen-stimulated suicide of mature T cells, or both. Binding to the decoy receptor TYRSF6B/DCR3 modulates its effects (By similarity).

MEMBER 6, MEMBRANE FORM.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        THYMOCYTES. MODERATE OR WEAK EXPRESSION FOUND IN SMALL INTESTINES, KIDNEY AND LUNG.
-! INDUCTION: BY PMA/IONOMYCIN AND CONCAVALIN/INTERLEUKIN-2.
-! PTM: The soluble form derives from the membrane form by proteolytic processing (By similarity).
-! SIMILARITY: Belongs to the tumor necrosis factor family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Rattus norvegicus (Rat).

"VEGI, a novel cyrckine of the tumor necrosis factor family, is an angiogenesis inhibitor that suppresses the growth of colon carcinomas
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SIGNAL-ANCHOR (TYPE-II MEMBRANE PROTEIN)
                                                                                                                                                                                                                  SUBCELLULAR LOCATION: Type II membrane protein (Probable).
IISSUE SPECIFICITY: Specifically expressed in endothelial cells.
                                                                                                                                                                  FASEB J. 13:181-189(1999).
-!- FUNCTION: Inhibits vascular endothelial growth and angiogenesis
                                                                                                                                                                                                                                          Detected in placenta, lung, kidney, skeletal muscle, pancreas, spleen, prostate, small intestine and colon. SIMILARITY: Belongs to the tumor necrosis factor family.
          Eukaryota, Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;
Mammalia; Eutheria; Primates; Catarrhini; Hominidae; Homo.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  POTENTIAL.

Natl. Acad. Sci. U.S.A. 99:16899-16903(2002).
-!- FUNCTION: Cytokine that binds to TNFRSF9/LTBR. Binding to the decoy receptor TNFRSF6B modulates its effects. Activates NFRS, stimulates the proliferation of T cells, and inhibits growth of the adenocarcinoma HT-29. Acts as a receptor for Herpes simplex
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Eukaryoča, Metazoa; Chordata; Craniata; Vertebrata; Buteleostomi;

                                                                                        A novel cytokine (AAW19777), designated Apo-2 ligand, induces mammalian cell apoptosis. It is belived to be a member of the tumnour necrosis factor cytokine family. Its amino acid sequence was deduced from a cDNA clone (AAT72796) isolated from a human placental cDNA library. Apo-2 ligand polypeptides, esp. those corresponding to amino acids 114-281, 15-281 or 1-281 of Apo-2 ligand, can be produced by culturing cells transformed or transfected with a vector contg. Apo-2 ligand nucleic pathological conditions such as cancer (esp. breast or colon cancer) or to raise antibodies useful in diagnostic assays
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 61 DDSYWDPNDEESMNSPCWQVKWQLRQLVRKMILRTSEETISTVQEKQQNISPLVRERGPQ 120

The present sequence represents a human Apoptosis inducing molecule-I (AIM-I). AIM-I is a member of the tumour necrosis factor (TNF) ligand superfamily. The products can be used in the diagnosis and treatment of disorders related to under-expression, over-expression or altered expression of AIM-I. AIM-I or agonists can be used for treating autoimmune disorders including systemic lupus erythematosus, immunoproliferative disease lymphadenopathy (IPI), rheumatoid arthritis, angioimmunoproliferative lymphadenopathy (AIL), rheumatoid arthritis, cliabetes, and multiple sclerosis, graft versus host disease, to inhibit neoplasia such as tumour cell growth, to treat restenosis, to regulate haematopolesis in endothelial cell development, to stimulate peripheral tolerance and cytotoxic T-cell mediated apoptosis. Antagonists can be to used for treating cachexia, cerebral malaria, rheumatoid arthritis or osteoporosis, for preventing graft-host rejection, and as anti-coll ammatory agents, for treating endotoxic shock or to prevent

Its amino acid agequence was deduced from cDNA clone HuAIC (AAT72848), deposited in vector pDC409 as ATCC 69849. Recombinant TRAIL polypeptides (esp. soluble polypeptides) can be expressed in host cells and used in the treatment of cancer (e.g. leukaemia, lymphoma and melanoma) and viral infections, or to raise antibodies that may be useful for treating thrombotic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               FYXIXSQTYFREQEEIKENTKNDKQMVQYIYKYTSYPDFILLMKSARNSCWSKDAEYGLY 240

                                                                                              inflammation, arthritis, septicaemia, autoimmune disease, restenosis, transplant rejection, infection, ischaemia, brain injury, bone disease, acute respiratory disease syndrome, acquired autoimmune disease syndrome, AIDS, cancer, atherosclerosis, Alxheimers disease, TRAIL, TNF, TL2. tumour necrosis factor-related apoptosis-inducing ligand.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             receptor, TL2 (also known as tumour necrosis factor-related apoptosis-inducing ligand, TRALI). This protein is used in a method resulting in the isolation of the novel human TNF related receptor, TR6. TR6 polypeptides and polynucleotides can be used in the treatment of chronic and acute inflammation, arthritis, septicaemia, autoimmune diseases (e.g. inflammatory bowel disease, isochaemia, acute respiratory disease syndrome, restenois, brain injury, (acquired autoimmune disease syndrome, restenois, brain injury, (acquired autoimmune disease diseases), atherosclevosis and Alzheimers disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        120

The human and murine TRAIL polypeptides can induce apoptosis of Jurkat cells. The encoding nucleic acid sequences are useful for producing the recombinant TRAIL polypeptides, which may be useful in studies of apoptosis, to purify leukaemia lymphoma or melanoma cells (e.g. to isolate antigens for vaccine development). The polypeptides can be used to treat leukaemia, lymphoma or melanoma (e.g. by extracorporeal treatment of blood or bone-marxow), or to treat viral infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          DDSYWDPNDEESWASPCWQVKWQLRQLVRKMILRTSEETISTVQEKQQNISPLVRERGPQ 120

The present sequence represents human AGP-1. AGP-1 is a tumour-necrosis factor (TNF) related protein, involved in inflammation, myelopoiesis and bone resorption. It has the ame nucleic acid and animo acid (aa) sequences as the TNF-related apoptosis-induced ligand (TRAIL) described in Immunity, 3 (1995) 673. Antibodies (Ab) are used as immunoassay caequences for detecting AGP-1 expression. Nucleic acid complementary to AGP-1 is used to regulate AGP-1 expression and antagonistic compounds are used to treat inflammation (e.g. rheumatoid anthritis, systemic lupus carythematics, pooriasis, scleroderma, infection-related inflammation) or bone resorption diseases (e.g. osteoporosis, osteomyelitis, hypercalcaemia, Paget's disease). AGP-1 can be used to treat home accordated with reduction in the number of bone marrow cells, particularly neutrophils and lymphocytes, e.g. where caused by disease, injury or exposure to myelosuppressive agents. Host cells, containing AGP-1 DNA, are used to

The specification describes the use a polypeptide corresponding to at disast the primary sequence of part of the present sequence to produce a diagnostic, prophylactic or therapeutic composition useful in cases of degenerative, autoimmune and inflammatory diseases. The polypeptides can be used in treatment of neurodegenerative disease, The polypeptides can rhuematoid arthritis, and SBP. The polypeptides are apoptotic in central nervous system cells, antigenci and specifically recognise the surface receptor of the TRAIL protein. The polypeptide is a marker of disease and a therapeutic target, e.g. its apoptotic activity can be blocked with an anti-TRAIL antibody or a TRAIL equivalent that binds to specific

The Apo-2L polypeptide can be produced by standard recombinant methodology. Apo-2L is useful for inducing apoptosis in mammalian cancer cells. This is useful for the tradment of cancer. Apo-2L can be used to induce apoptosis for pathological conditions characterized by decreased levels of apoptosis, e.g. autoimmune disorders like lupus and immunemedated glomerular nephritis and cancer. Apo-2L and its nucleic acid coding sequence can also be used in quantitative and screening diagnostic techniques. Anti-Apo-2L antibodies can be used for treating diseases associated with increased apoptosis
                                                                                                                                                                       240

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes an antibody that binds to a human protein (I) selected from: PRO381; PRO1269; PRO1410; PRO155; PRO1780; PRO3434; PRO1277; PRO3567; PRO1293; PRO1293; PRO1303; PRO4344; PRO4354; PRO4397; PRO4407; PRO1555; PRO1096; PRO2038; and PRO2262. (I) has anticancer activity and can be used to diagnose tumours in mammals, by detecting complex formation when the antibody is contacted with test cells. Increased expression of genes encoding (I) can also be detected to
                                                                                                                                                    120
                                                                                                                                                                                   180

This sequence is the human Apo-2 ligand protein, which is recognised by monoclonal antibodies produced by the hybridoma cell lines of the invention. The Mybridoma cell lines are deposited under the American Type Culture Collection Accession Numbers. ATCC HB-12256, HB-12257, HB-12258 and HB-12259. The Apo-2 ligand antibodies may be used in diagnostic assays for Apo-2 ligand, e.g. detecting its expression in specific cells, tissues, or serum. The antibodies may also be employed as therapeutics. For instance, anti-Apo-2 ligand antibodies which block Apo-2 ligand activity, like Apo-2 ligand antibodies which block Apo-2 ligand activity, like Apo-2 ligand-induced apoptosis, may be employed to treat activity, like Apo-2 ligand-induced apoptosis, may be applosed from recombinant cell culture or natural sources. The Apo-2 ligand from recombinant cell culture or natural sources. The Apo-2 ligand itself may be used to treat diseases e.g. cancer, by inducing apoptosis in cells.

Sequence 281 AA;

New isolated monoclonal antibodies having antigen specificity for Apo-2 ligand, e.g. 2G6, 2E11 or 5C2, useful for detecting the expression of Apo -2 ligand serum, and for treating diseases associated with increased

Claim 9; Fig la; 46pp; English.

apoptosis.

diagnose tumours. Agents which inhibit the activity of (I), especially the antibodies, or an antisense oligomuclectide which hybridises to genes encoding (I), can be used to inhibit tumour growth, preferably by inducing cell death. Methods from the present invention can be used to identify compounds which inhibit the biological activity of (I). AAC58019 to AAC58102 represent PCR primers and hybridisation probes used in examples from the present invention for human PRO sequences. AAC58103 to AAC58122 and AAB24021 to AAB24040 represent human PRO polymucleotide and protein sequences given in the exemplification of the present invention

                                            (TNF) related apoptosis-inducing ligand) polypeptide. The specification describes a method for enhanced killing of tumour cells. The method comprises contacting a susceptible tumour cell with a synergistic mixture of a TRAIL receptor ligand and a diterpenoid triepoxide in a combined dosage to kill at least 50 % of the cells. This mixture is synergistic, and so is active at lower doses and against otherwise resistant cell lines. The method is used for killing tumour cells, especially solid tumours or carcinomas (especially mammary carcinoma or non-small cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             180

The present sequence is human AGP-1, a type II transmembrane protein. Fusion proteins comprising an FC immunoglobulin region fused to the N-terminal portion of the AGP-1 protein have been produced. The fusion proteins can be used to induce apoptosis in a tissue, and to treat proliferative disorders, immune disorders, or virally-induced disorders. The proliferative disorders include cancers, such as breast, prostate, lung or colon cancer. The viral infections include hepatitis, and acquired immunodaficiancy syndrome (AIDS), and the immune disorders may be autoimmune disorders or transplant rejection. Cardiovascular diseases such as arteriosclerosis may also be treated. The AGP-1 containing fusion proteins have increased biological activity compared to the soluble AGP-1 proteins used in prior art therapies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               RVAAHITGTRGRSNTLSSPNSKNEKALGRKINSWESSRSGHSFLSNLHLRNGELVIHEKG 180

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is one of twenty eight novel PRO polypeptides. The PRO polypeptides and their agonists, including antibodies, peptides, and small molecule agonists, may be used to treat various tumours, e.g., cancers such as breast cancer, ovarian cancer, renal cancer, colorectal cancer, uterine cancer, prostate cancer, lung cancer, bladder cancer, central nervous system cancer, melanoma or leukaemia. They are also useful for treating other disorders such as neuronal, glial, astrocytal, hypothalamic and other glandlar, macrophagal, epithelial, stromal and blastocoelic disorders, and inflammatory, angiogenic and immunological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1 MAMMEVOGGPSLGQTCVLIVIFTVLLQSLCVAVTYVYFTNELKQMQDKYSKSGIACFLKE 60

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         DDSYMDPNDEESMNSPCWQVKWQLRQLVRKMILRTSEETISTVQEKQQNISPLVRERGPQ 120
                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to a formulation comprising Apo-2 ligand and divalent metal ions. Apo-2 ligand and the formulation are useful for treating cancers and viral infections. Addition of divalent metal ions for making Apo-2 ligand and formulations containing Apo-2 ligand results in increased yield and stability of Apo-2 ligand trimers

The invention relates to a cytokine designated as tumour necrosis factor (TNF) related apoptosis inducing ligand (TRAIL), which induces apoptosis of certain target cells, including cancer cells and virally infected cells. The TRAIL polypeptides are useful in killing cancer cells, in treating viral infections (e.g. bovine viral diarrhoea or human minumunodeficiency virus (HIV)) and cancers (e.g. lenkaemia, lymphoma and melanoma), as a research reagent useful in studying apoptosis including the regulation of programmed cell death. TRAIL DNA sequences may be employed in developing a gene therapy approach to treating disorders mediated by defective or insufficient amounts of TRAIL, in the production of TRAIL polypeptides and as probes or primers in polymerase chain reactions (PCR). The present sequence is human TRAIL protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    121 RVAAHITGTRGRSNTLSSPNSKNEKALGRKINSWESSRSGHSFLSNLHLRNGELVIHEKG 180

AB Soluble mouse and human Fas ligand polypeptides and methods are useful for inhibiting T-lymphocyte-mediated immune responses, treating inflammation or preventing transplant rejection. The Fas ligand may be provided to the recipient mammal by a variety of means, including by direct administration of the Fas ligand or by providing the gene encoding the Fas ligand to a subject such that Fas ligand is synthesized by the subject. Also, antibody and monoclonal antibody against the mouse and human Fas ligand epitopes are claimed.

- 1996:402030 Document No. 125:84664 Novel mammalian Fas ligands and cDNAs encoding them and their use in the therapeutic regulation of apoptosis. Nagata, Shigekazu; Suda, Takashi; Takahashi, Tomohiro; Nakamura, Norio (Mochida Pharmaceutical Co., Ltd., Japan; Osaka Bioscience Institute). Eur. Pat. Appl. EP 675200 Al 19951004, 175 pp. DESIGNATED STATES: R: AT, BE, CH, DE, DK, ES, FR, GB, GR, IE, IT, LI, LU, MC, NL, PT, SE. (English). CODEN: EPXXDW. APPLICATION: EP 1994-117761 19941110. PRIORITY: JP 1993-305975 19931110; JP 1993-342526 19931213; JP 1994-74344 19940318; JP 1994-180955 19940708; JP 1994-239363 19940907; JP 1994-278378 19941018.
- AB Novel polypeptide ligands for the Fas antigen are identified, purified and characterized and cDNAs encoding them are cloned and expressed. These proteins may be manufactured for regulation of apoptosis by expression of the cloned cDNA for therapeutic use or in the preparation of antibodies. These proteins have a cytoplasmic domain, a transmembrane domain and extracellular domain and takes part in apoptosis. CDNAs for these ligands were cloned by panning of an expression library in COS-7 cells. Monoclonal antibodies to the ligand were prepared and shown to inhibit Fas ligand-induced apoptosis. Antisense oligonucleotides to the Fas gene were able to inhibit gene expression.
- MEDLINE on STN DUPLICATE 1 L3ANSWER 3 OF 3 PubMed ID: 7980502. Role of Fas ligand in apoptosis induced by 95071350. hepatitis C virus infection. Mita E; Hayashi N; Iio S; Takehara T; Hijioka T; Kasahara A; Fusamoto H; Kamada T. (First Department of Medicine, Osaka University School of Medicine, Japan.) Biochemical and biophysical research communications, (1994 Oct 28) 204 (2) 468-74. Journal code: 0372516. ISSN: 0006-291X. Pub. country: United States. Language: English. To investigate the role that Fas ligand plays in the apoptosis of AΒ hepatocytes induced by hepatitis C virus infection, we isolated a cDNA clone for human Fas ligand and examined the expression of Fas ligand in liver-infiltrating mononuclear cells obtained from patients with chronic hepatitis C. The amino acid sequence of human Fas ligand showed 76% and 77% identity with those of rat and mouse Fas ligand,

respectively. When the expression of Fas ligand transcripts was tested by reverse transcription-polymerase chain reaction, the amplified signal was detected in liver-infiltrating mononuclear cells and peripheral blood mononuclear cells, whereas only a weak signal or none at all was detected in liver tissues. These findings suggest that the Fas ligand-Fas antigen system may play an important role in liver cell injury by hepatitis C virus infection.

- An ew member of the human TNF-Ligand superfamily, Apoptosis Inducing Mol. II (AIM II) is identified by sequence homol. for use in the treatment of immune disorders. The protein is a ligand for the TNF receptor TR6 and so may be used for the therapeutic induction of apoptosis or as a target for new drugs for the therapeutic inhibition of apoptosis. The invention further relates to screening methods for identifying agonists and antagonists of AIM II activity. Also provided are therapeutic methods for treating lymphadenopathy, aberrant bone development, autoimmune and other immune system diseases, graft vs. host disease, rheumatoid arthritis, osteoarthritis and to inhibit neoplasia, such as tumor cell growth.

- The present invention relates to a novel member of the TNF-Ligand superfamily. More specifically, isolated nucleic acid molecules are provided encoding a human Apoptosis Inducing Molecule II (AIM II). AIM II polypeptides are also provided, as are vectors, host cells and recombinant methods for producing the same. The invention further relates to screening methods for identifying agonists and antagonists of AIM II activity. Also provided are therapeutic methods for treating lymphadenopathy, aberrant bone development, autoimmune and other immune system diseases, graft versus host disease, rheumatoid arthritis, osteoarthritis and to inhibit neoplasia, such as tumor cell growth.

- The present invention relates to a novel member of the TNF-Ligand superfamily, Apoptosis Inducing Molecule II (AIM II). In particular, isolated nucleic acid molecules are provided encoding the human AIM II protein. AIM II polypeptides are also provided as are vectors, host cells and recombinant methods for producing the same. The invention further relates to screening methods for identifying agonists and antagonists of AIM II activity. Also provided are therapeutic methods for treating lymphadenopathy, autoimmune disease, graft versus host disease, and to inhibit neoplasia, such as tumor cell growth.

 AB The present invention relates to a novel member of the TNF-Ligand
 - The present invention relates to a novel member of the TNF-Ligand superfamily, Apoptosis Inducing Mol. II (AIM II). In particular, isolated nucleic acid mols. are provided encoding the human AIM II protein. AIM II polypeptides are also provided as are vectors, host cells and recombinant methods for producing the same. The effect of AIM II on the cell growth are tested in breast cancer cell line or xenograft human breast carcinoma cell MDA in nude mice. Soluble AIM II can mediate cytotoxicity in HT-29 cell and stimulate secretion of IFNγ in human PBL cells. Cell surface expression of β-lymphokine receptor fusion protein LTβR-Fc or TR2-Fc fusion protein can block soluble AIM II-mediated cytotoxicity in HT-29 cells and AIM II can bind to LTβR specifically. The invention further relates to screening methods for identifying agonists and antagonists of AIM II activity. Also provided are therapeutic methods for treating lymphadenopathy, autoimmune disease, graft vs. host disease, and to inhibit neoplasia, such as tumor cell growth.

- The present invention relates to a member of the TNF-Ligand superfamily. AB More specifically, isolated nucleic acid mols. are provided encoding a human Apoptosis-Inducing Mol. II (AIM II). The nucleic acid was discovered in a cDNA library derived from human macrophage ox LDL, and shown to contain an open reading frame encoding a protein of 240 amino acid residues. AIM II polypeptides are also provided, as are vectors, host cells and recombinant methods for producing the same. AIM II is highly expressed in activated lymphocytes but not in cancer cells. The protein has potent antitumor activity in vivo and in vitro and both lymphotoxin β receptor and TR2 are required for AIM II-induced growth inhibition of cancer cells. The invention further relates to screening methods for identifying agonists and antagonists of AIM II activity. Also provided are therapeutic methods for treating lymphadenopathy, aberrant bone development, autoimmune and other immune system diseases, graft vs. host disease, rheumatoid arthritis, osteoarthritis and to inhibit neoplasia, such as tumor cell growth.

1999123371. PubMed ID: 9924296. Vertical cup/disc ratio in relation to optic disc size: its value in the assessment of the glaucoma suspect.

Garway-Heath D F; Ruben S T; Viswanathan A; Hitchings R A.

(Glaucoma Unit, Moorfields Eye Hospital, London.) British journal of ophthalmology, (1998 Oct) 82 (10) 1118-24. Journal code: 0421041. ISSN: 0007-1161. Pub. country: ENGLAND: United Kingdom. Language: English.

AB AIMS: The vertical cup/disc ratio (CDR) has long been used in the assessment of the glaucoma suspect, though the wide range of CDR values in the normal population limits its use. Cup size is related physiologically to disc size and pathologically to glaucomatous damage. Disc size can be measured at the slit lamp as the vertical disc diameter

- (DD). The ability of the CDR, in relation to DD, to identify glaucomatous optic discs was investigated. METHODS: 88 normal, 53 early glaucoma, and 59 ocular hypertensive subjects underwent stereoscopic optic disc photography and clinical biometry. Photographs were analysed in a masked fashion by computer assisted planimetry. The relation between vertical cup diameter and DD was explored by linear regression, and expressed in terms of CDR. The upper limit of normal was defined by the 95% prediction intervals of this regression (method 1) and by the upper 97.5 percentile for CDR (method 2). The sensitivity and specificity of CDR to identify an optic disc as glaucomatous was tested with these disc size dependent and disc size independent cut offs in small, medium, and large discs. RESULTS: The CDR was related to DD by the equation CDR = $(-1.31 + (1.194 \times 1.00))$ DD))/DD. The sensitivity in small, medium, and large discs was 80%, 60%, and 38% respectively for method 1 and 33%, 67%, and 63% respectively for method 2. Specificity was 98.9% (method 1) and 97.7% (method 2). CONCLUSIONS: The CDR, relative to disc size, is useful clinically, especially to assist in identifying small glaucomatous discs.

graft vs. host disease, and to inhibit neoplasia, such as tumor cell

growth.

The invention relates to apoptosis-inducing mol. I (AIM-I) AΒ polypeptides, polynucleotides encoding the polypeptides, methods for producing the polypeptides, in particular by expressing the polynucleotides, and agonists and antagonists of the polypeptides. AIM-I cDNA was discovered in a cDNA library derived from cells of a human pancreatic tumor and shown to contain an open reading frame encoding 281 amino acid residues with 48.6% similarity and 22.9% identity to human Fas ligand. Northern blot anal. shows that AIM-I mRNA is abundant in human heart, bone marrow, CD4+ and CD19+ peripheral blood lymphocytes, and less so in lung and kidney tissue. Cloning of human AIM-I cDNA was demonstrated by expression in Escherichia coli using the bacterial expression vector pQE9, expression in a baculovirus expression system using the pA2 vector, expression in COS cells using the pcDNAI/Amp vector, and gene therapeutic expression. The invention further relates to methods for utilizing such polynucleotides, polypeptides,

agonists and antagonists for applications, which relate, in part, to research, diagnostic and clin. arts.

L6 ANSWER 14 OF 14 MEDLINE on STN DUPLICATE 3
95260771. PubMed ID: 7742276. Pattern electroretinogram and peripheral colour contrast thresholds in ocular hypertension and glaucoma: comparison and correlation of results. Ruben S T; Arden G B; O'Sullivan F; Hitchings R A. (Electrodiagnostic Department, Moorfields Eye Hospital, London.) British journal of ophthalmology, (1995 Apr) 79 (4) 326-31. Journal code: 0421041. ISSN: 0007-1161. Pub. country: ENGLAND: United Kingdom. Language: English.

AIMS--Both pattern electroretinogram and peripheral colour AΒ contrast thresholds have been shown to be abnormal in glaucoma and ocular hypertension. This study evaluates each of these tests as tools for the early diagnosis of glaucoma, compares and contrasts the results, and examines the relation between the two tests in a large cohort of ocular hypertensive patients. METHODS--Transient and steady state pattern electroretinograms and peripheral colour contrast thresholds were performed in 45 normal, 37 glaucomatous, and 206 ocular hypertensive eyes. The results were analysed using receiver operating characteristic curves, together with evaluation of sensitivity and specificity of the tests. The relation between the two tests was examined by direct statistical correlation of the results. RESULTS--All tests showed high sensitivity and specificity for discriminating between normal and glaucomatous eyes. However, there was a significant difference between the two tests for the number of ocular hypertensives considered as abnormal. Forty per cent of ocular hypertensives had abnormal pattern electroretinogram compared with 30% with abnormal peripheral colour vision. Peripheral colour contrast thresholds showed a significant correlation with both transient and steady state pattern electroretinogram. CONCLUSION--Both of these tests have been shown to be promising new tools for the early detection of glaucoma but the number of ocular hypertensive patients showing abnormal results is rather higher than expected considering the natural history of the condition. Sensitivity in ocular hypertension may be increased by using a combination of both tests. The significant correlation between these psychophysical and electrophysiological tests is discussed.
